

Imerys Talc for Agricultural Applications

Imerys talc is a multifunctional additive for use in a wide range of agricultural applications. Its platy structure, hydrophobicity, natural softness and long term record of safe use makes it a perfect lubricant, flow improver and coating ingredient for sticky meal, seed and fruit.

For soya meal, Imerys EZFlow MT or EZFlowVT can be added at up to 2% to adsorb oil, repel moisture and dramatically improve the handling of the feedstuff without adding abrasive ingredients that come in local clays and limestones.

In seed coating, talc is the perfect pigment to build up your seed in a latex coating or lubricate your seeding machine for better performance. Use Imerys TC100 or Silverline 002 to get the best coating and lubrication at lower cost than graphite. EZFlow VT is the preferred product for Northeastern potato seed producers and Silverline 002 for Idaho and Washington seed suppliers.

Invelop or Silverline 002 can be used to spray on fruit to prevent excessive sunburn and easily washed off after picking while Talcoliva TF is the perfect additive to use in your olive oil extraction plant to maximize the production of extra virgin grades.

Contact your Imerys Talc technical sales manager or agent to get samples or more information .
