Products

DeCAL 2020 Polyether Polyurethane Thickener

DeCAL 2020 rheology modifier enables the formulation of paints with a Newtonian rheology and is suitable for use in a wide range of paints (from flat to high gloss). To obtain the best balance of flow and sag resistance it can be used in combination with other thickeners, of natural or synthetic origins. It is supplied as a pourable and pumpable liquid, free of solvent.

Applications

DeCAL 2020 allows development of formulations for gloss and semi-gloss paints for brush applications, with excellent flow and levelling properties. For roller application, however, it is suggested to use it in combination with other more pseudoplastic thickeners.

Benefits

- Excellent film build, flow and levelling
- High-gloss development
- Solvent-free
- Stability over a wide pH range
- Resistance to microbial degradation
